General Information

Caution

Data transmission errors

Any attempt to simultaneously operate the gauge via the RS232C Serial Interface and EtherCAT interface or the diagnostic port may result in incorrect data and data transmission errors.

Therefore, it is inadmissible to simultaneously operate the gauge via the RS232C Serial Interface and EtherCAT interface, or the diagnostic port.

Intended Use

This Communication Protocol contains instructions for operating EtherCAT interfaces (slaves) together with a master.

For safety information, specifications and operation instructions of the vacuum gauges refer to the appropriate documents:

EtherCAT-Interface

The following description of the EtherCAT interface is compliant to the EtherCAT specification of the EtherCAT Technology Group (ETG) and to the "EtherCAT Semiconductor Device Profile".

This manual describes the functionality of a EtherCAT slave and supports

- ETG.5003.1 S (R) V1.1.0: Part 1 Common Device Profile (CDP) (→ [17]) and
- ETG.5003.2080 S (R) V1.3.0: Part 2080: Specific Device Profile (SDP) Vacuum Pressure Gauge (→ [18]).

For operating the gauge via EtherCAT, prior installation of the device specific ESI file is required on the bus master side. This file can be downloaded from our web-site.

Product Identification

In all communications with INFICON, please specify the information on the product nameplate. For convenient reference copy that information into the space provided below.

Validity

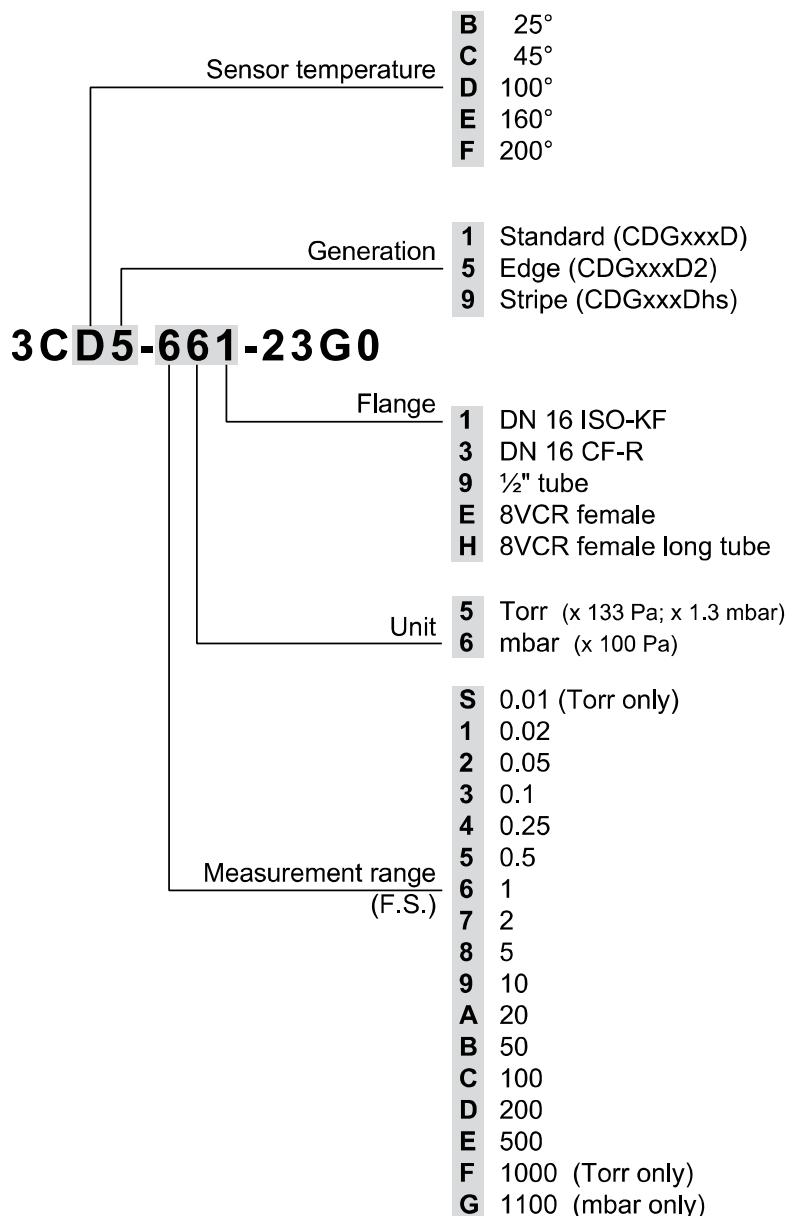

This document applies to products of the CDG025D2, CDG045D, CDG045D2, CDG045Dhs, CDG100D, CDG100D2, CDG100Dhs, CDG160D, CDG160Dhs, CDG200D and CDG200Dhs series with EtherCAT interface.

This manual is based on firmware version 1.3.0.0.

If your unit does not work as described in this document, please check that it is equipped with the above firmware version:

- CDG025D2, CDG045D, CDG045D2, CDG100D, CDG100D2, CDG160D and CDG200D → [14](#), Index 100A
- CDG045Dhs, CDG100Dhs, CDG160Dhs and CDG200Dhs → [38](#), Index 100A

Part numbers of standard products are indicated below. OEM products have other part numbers and different parameter settings (e.g. factory setting of setpoint) as defined in the corresponding ordering information.

The part number (PN) can be taken from the product nameplate.

If not indicated otherwise in the legends, the illustrations in this document correspond to CDG045D gauges with the DN 16 ISO-KF vacuum connection. They apply to other vacuum connections and to the other gauges by analogy.

We reserve the right to make technical changes without prior notice.

EtherCAT interface

Communication protocol	protocol specialized for EtherCAT
Communication standards	ETG.5003.1 S (R) V1.1.0: Part 1 Common Device Profile (CDP) (→  [17]) ETG.5003.2080 S (R) V1.3.0: Part 2080: Specific Device Profile (SDP) Vacuum Pressure Gauge (→  [18])
Data rate	100 Mbps
Node address	Explicit Device Identification
Physical layer	100BASE-Tx (IEEE 802.3)
EtherCAT connector	2 × RJ45, 8-pin (socket) <IN>: EtherCAT input <OUT>: EtherCAT output
Cable	shielded, special Ethernet Patch Cable (CAT5e quality or higher)
Cable length	≤100 m
Process data	Fixed PDO mapping and configurable PDO mapping
Mailbox (CoE)	SDO requests, responses and information

2 Interface Connection

Making an EtherCAT interface cable

For operating the temperature controlled CDGxxxD gauge via EtherCAT, two interface cables conforming to the EtherCAT standard are required. If no such cables are available, make two according to the following indications.

Cable type

Ethernet Patch Cable Cable (CAT5e quality) with FCC68 connector.

Procedure

1 Pin assignment:

FCC68, 8-pin,
male, soldering side

Pin	Signal	Description
1	TD+	Transmission Data +
2	TD-	Transmission Data -
3	RD+	Receive Data +
4	nu	not used
5	nu	not used
6	RD-	Receive Data -
7	nu	not used
8	nu	not used

Pin assignment of the D-sub 15-pin sensor connector according to the respective operating manual (→  [1] ... [8]).

- 2** Plug the EtherCAT (and sensor) cables connector into the gauge: From the previous device the cable connected to OUT port has to be connected to the CDGxxxD <IN> port. And the cable from the CDGxxxD <OUT> port has to be connected to the next device's <IN> port.

3 Operation

3.1 Introduction

Via the EtherCAT interface, the following and further data are exchanged in the standardized EtherCAT protocol:

- Pressure reading
- Pressure unit (Torr, mbar, Pa)
- Zero adjustment
- Status and error messages
- Status of the switching functions
- Set Trip Point for switching functions

Caution

Data transmission errors

Any attempt to simultaneously operate the gauge via the RS232C Serial Interface and EtherCAT interface or the diagnostic port may result in incorrect data and data transmission errors.

Therefore, it is inadmissible to simultaneously operate the gauge via the RS232C Serial Interface and EtherCAT interface or the diagnostic port.

3.3 Indicators and Switches

3.3.1 <RUN> LED

Displays the operating status.

Color	LED State	Description
green	off	INIT (initialization status) or no power applied to device.
	blinking (200 ms on 200 ms off)	PREOP (pre-operational status).
	single flash (200 ms on 1000 ms off)	SAFEOP (safe-operational status). Communication of cyclic data transfer running. Input values available, output values written to the device but not updated on device output.
	on	OP (operational status).

3.3.2 <ERR> LED

Displays the error content.

Color	LED State	Description
red	off	No error or no power applied to device.
	blinking (200 ms on 200 ms off)	Error occurred (see error parameter).
	single flash (200 ms on 1000 ms off)	Slave device application has changed the EtherCAT state autonomously, due to local error (see error parameter).
	double flash (200 ms on 200 ms off 200 ms on 1000 ms off)	An application watchdog timeout has occurred. Sync Manager Watchdog timeout or communication timeout occurred.
	on	A critical communication or application controller error has occurred. Application controller is not responding any more (PDI Watchdog Timeout detected by ESC)

3.3.3 <LA> LED (<IN> Port)

Displays the input status.

Color	LED State	Description
green	off	Port not connected or no power applied to device.
	blinking	Port connected and communication active.
	on	Port connected but no communication.

3.3.4 <LA> LED (<OUT> Port)

Displays the output status.

Color	LED State	Description
green	off	Port not connected or no power applied to device.
	blinking	Port connected and communication active.
	on	Port connected but no communication.

3.3.5 Device Address Switch

During device initialization, the device address switches are read by the device firmware. This device address is supported to the master as Explicit Device Identification.

Example: Value of the Explicit Device ID = 0xDDD (dec 3549):
 $0x100 * 0xD$ (dec 3328) + $0x10 * 0xD$ (dec 208) + $0x1 * 0xD$ (dec 13)

4 Object Structure CDG025D2, CDG045D, CDG045D2, CDG100D, CDG100D2, CDG160D, CDG200D

This chapter describes the CANopen over EtherCAT (CoE) Object Dictionary.

4.1 Object Dictionary structure

The objects in the CoE Object Dictionary can be accessed with SDO services, and many of the dictionary objects can be mapped for cyclic communication in PDO's. Each object is addressed using a 16-bit index and an 8-bit subindex.

The following table presents the overall layout of the standard Object Dictionary.

Index (hex.)	Object dictionary area	
1000 – 1FFF	Communication profile area	
2000 – 5FFF	Manufacturer-specific profile area	
6000 – 6FFF	Profile Specific Area	Input area
7000 – 7FFF		Output area
8000 – 8FFF		Configuration area
9000 – 9FFF		Information area
A000 – AFFF		Diagnosis area
B000 – BFFF		Service Transfer area
C000 – EFFF		Reserved area
F000 – FFFF		Device area

Explanations for the abbreviations in the columns of the tables are given below:

Abbr.	Description
Access	SDO read/write access <ul style="list-style-type: none"> RO: object can only be read by the SDO service RW: object can be both read and written by the SDO service
CoE	CAN application protocol over EtherCAT
Index	Object Index (hex.) (address of an object)
NV	Nonvolatile; attribute value is maintained through power cycles
Object	Abstract representation of a particular component within a device, which consists of data, parameters, and methods.
PDO	Process Data Object. Structure described by mapping parameters containing one or several process data entities.
PM	PDO mapping <ul style="list-style-type: none"> Rx: object can be mapped into an Rx PDO Tx : object can be mapped into a Tx PDO
RxPDO	Receive PDO. A Process Data Object received by an EtherCAT slave.
SDO	Service Data Objects. CoE asynchronous mailbox communications where all objects in the Object Dictionary can be read and written.
SI	Subindex (hex.) (sub-address of an object)
Type	Data Type <ul style="list-style-type: none"> BOOL, BIT = 1 bit. Boolean (0 = false, 1 = true) USINT, BYTE = 8 bit. Unsigned Byte UINT = 16 bit. Unsigned integer value UDINT = 32 bit. Unsigned integer value ULINT = 64 bit. Unsigned integer value REAL = 32 bit. Floating point V_STRING = 8xn bit. Visible string (1 byte for character)
TxPDO	Transmit PDO. A Process Data Object sent from an EtherCAT slave.

4.2 Communication Profile Objects (0x1000...0x1FFF)

The objects of the communication profile describe the basic EtherCAT properties of the CDGxxxD and are common to all EtherCAT slaves using the CoE communication protocol. The objects are described in following table:

Index	SI	DataType	NV	Access	PM	Name
1000		UDINT		RO		Device Type

4.2.1 Process Data Objects (PDO's)

CDGxxxD gauges only: They consist of one vacuum pressure sensor with an additional sensor measuring the ambient pressure (ATM).

For each sensor module a default mapping is configured.

Or to meet other requirements the TxPDO's 1A01, 1A03 or 1BFF and the RxPDO 1601 are designated for user mapping. These PDO's do not have default values and can be set up by the PDO configuration.

4.5.1 Configuration Capacitance Diaphragm

Index	SI	Data Type	NV	Access	PM	Name
8001	0x12	REAL	x	RW		Offset Customer Specific

Subindex 0x12

Customer-specified Offset which shall be added to the Value parameter of the Analog Input Sensor instance.

The Offset Customer Specified parameter is a value added from a Zero Adjust Service to the reported pressure value.

Value shall be calculated as:

$$\text{Value}^{\text{)}} = \text{Reported pressure value} + \text{AZO}^{\text{**)}} + \text{OCS}^{\text{***)}})$$

⁾ Value (I: 0x6000, SI: 0x11)

^{**)} Accumulated Zero Offset (I: 0x9000, SI: 0x01)

^{***)} Offset Customer Specified (I: 0x8001, SI: 0x12)

4.5.2 Configuration Trip Point

The High Trip Point is calculated by:

$$\text{High Trip Point} = \text{Value}^{\text{)}} \times \text{Percentage}^{\text{**)}})$$

⁾ Value from Piezo Sensor (I: 0x6010, SI: 0x11)

^{**)} Percentage High Trip Source (I: 0x800E/F, SI: 0x13)

In this case, the High Trip Point value is automatically updated by the device itself. Any user-written value to the parameter High Trip will be refused with an abort code.

Usage of High Trip Point is only recommended for measurement range 1000 Torr or 1100 mbar.

The Low Trip Point is a fixed value:

The value defined in Low Trip Point Limit is compared with the pressure value referenced by the Source Index parameter.

4.6 Information Area (0x9000...0x9FFF)

Highest / lowest measurement value

The Information Data object defines the input process data.

The "measurement range" is the range between minimum and maximum pressure, where the reading of the gauge is within the specified measurement uncertainty limits.

The "valid measurement information range" (display range) is the complete pressure range where the gauge gives an indication (measurement signal). The valid measurement information range (display range) consists of underrange, measurement range and overrange.

According to these definitions, 4 points are defined:

- 1 Lowest informational measurement value
- 2 Lowest precision measurement value
- 3 Highest precision measurement value
- 4 Highest informational measurement value

Accumulated Zero Offset: An amount added prior to Gain to derive Value. Result of Zero Adjust Command (accumulated value).

Subindex 0x02

Highest Informational Measurement Value: Highest value that the gauge can measure without a specified accuracy.

Subindex 0x03

Highest Precision Measurement Value: Highest valid value at which the gauge is specified with an accuracy value. Above that value, the parameter Reading Valid is set to invalid.

Subindex 0x04

Lowest Precision Measurement Value: Lowest valid value at which the gauge is specified with an accuracy value. Below that value, the parameter Reading Valid is set to invalid.

Subindex 0x05

4.7.24 Device Reset Command

Execution of this command causes the device to emulate a complete power cycle. This includes an ESC reset.

As consequence of an ESC reset all following devices are disconnected from the network.

There are two versions of this command:

- Standard reset (as described above)
- Factory reset (as described above, but additionally, all parameters are restored to as-shipped defaults).

5 Object Structure CDG045Dhs, CDG100Dhs, CDG160Dhs, CDG200Dhs

This chapter describes the CANopen over EtherCAT (CoE) Object Dictionary.

5.1 Object Dictionary structure

The objects in the CoE Object Dictionary can be accessed with SDO services, and many of the dictionary objects can be mapped for cyclic communication in PDO's. Each object is addressed using a 16-bit index and an 8-bit subindex.

The following table presents the overall layout of the standard Object Dictionary.

Index (hex.)	Object dictionary area	
1000 – 1FFF	Communication profile area	
2000 – 5FFF	Manufacturer-specific profile area	
6000 – 6FFF	Profile Specific Area	
7000 – 7FFF		Input area
8000 – 8FFF		Output area
9000 – 9FFF		Configuration area
A000 – AFFF		Information area
B000 – BFFF		Diagnosis area
C000 – CFFF		Service Transfer area
D000 – DFFF		Reserved area
E000 – EFFF		Device area

Explanations for the abbreviations in the columns of the tables are given below:

Abbr.	Description
Access	SDO read/write access <ul style="list-style-type: none"> RO: object can only be read by the SDO service RW: object can be both read and written by the SDO service
CoE	CAN application protocol over EtherCAT
Index	Object Index (hex.) (address of an object)
NV	Nonvolatile; attribute value is maintained through power cycles
Object	Abstract representation of a particular component within a device, which consists of data, parameters, and methods.
PDO	Process Data Object. Structure described by mapping parameters containing one or several process data entities.
PM	PDO mapping <ul style="list-style-type: none"> Rx: object can be mapped into an Rx PDO Tx : object can be mapped into a Tx PDO
RxPDO	Receive PDO. A Process Data Object received by an EtherCAT slave.
SDO	Service Data Objects. CoE asynchronous mailbox communications where all objects in the Object Dictionary can be read and written.
SI	Subindex (hex.) (sub-address of an object)
Type	Data Type <ul style="list-style-type: none"> BOOL, BIT = 1 bit. Boolean (0 = false, 1 = true) USINT, BYTE = 8 bit. Unsigned Byte UINT = 16 bit. Unsigned integer value UDINT = 32 bit. Unsigned integer value ULINT = 64 bit. Unsigned integer value REAL = 32 bit. Floating point V_STRING = 8xn bit. Visible string (1 byte for character)
TxPDO	Transmit PDO. A Process Data Object sent from an EtherCAT slave.

5.2 Communication Profile Objects (0x1000...0x1FFF)

The objects of the communication profile describe the basic EtherCAT properties of the CDGxxxD and are common to all EtherCAT slaves using the CoE communication protocol. The objects are described in following table:

Index	SI	DataType	NV	Access	PM	Name

10F8		ULINT		RO		Timestamp Object

5.2.1 Process Data Objects (PDO's)

CDGxxxD gauges only: They consist of one vacuum pressure sensor with an additional sensor measuring the ambient pressure (ATM).

For each sensor module a default mapping is configured.

Or to meet other requirements the TxPDO's 1A01, 1A03 or 1BFF and the RxPDO 1601 are designated for user mapping. These PDO's do not have default values and can be set up by the PDO configuration.

5.5.1 Configuration Capacitance Diaphragm

Index	SI	Data Type	NV	Access	PM	Name
8001	0x12	REAL	x	RW		Offset Customer Specific

Subindex 0x12

Customer-specified Offset which shall be added to the Value parameter of the Analog Input Sensor instance.

The Offset Customer Specified parameter is a value added from a Zero Adjust Service to the reported pressure value.

Value shall be calculated as:

$$\text{Value}^{\text{)}} = \text{Reported pressure value} + \text{AZO}^{\text{**)}} + \text{OCS}^{\text{***)}})$$

⁾ Value (I: 0x6000, SI: 0x11)

^{**)} Accumulated Zero Offset (I: 0x9000, SI: 0x01)

^{***)} Offset Customer Specified (I: 0x8001, SI: 0x12)

5.5.2 Configuration Trip Point

The High Trip Point is calculated by:

$$\text{High Trip Point} = \text{Value}^{\text{)}} \times \text{Percentage}^{\text{**)}})$$

⁾ Value from Piezo Sensor (I: 0x6010, SI: 0x11)

^{**)} Percentage High Trip Source (I: 0x800E/F, SI: 0x13)

In this case, the High Trip Point value is automatically updated by the device itself. Any user-written value to the parameter High Trip will be refused with an abort code.

Usage of High Trip Point is only recommended for measurement range 1000 Torr or 1100 mbar.

The Low Trip Point is a fixed value:

The value defined in Low Trip Point Limit is compared with the pressure value referenced by the Source Index parameter.

5.6 Information Area (0x9000...0x9FFF)

The Information Data object defines the input process data.

Highest / lowest measurement value

The "measurement range" is the range between minimum and maximum pressure, where the reading of the gauge is within the specified measurement uncertainty limits.

The "valid measurement information range" (display range) is the complete pressure range where the gauge gives an indication (measurement signal). The valid measurement information range (display range) consists of underrange, measurement range and overrange.

According to these definitions, 4 points are defined:

- 1 Lowest informational measurement value
- 2 Lowest precision measurement value
- 3 Highest precision measurement value
- 4 Highest informational measurement value

5.6.1 Information Common Capacitance Diaphragm

	0x02	REAL	x	RO		Highest Informational Measurement Value
	0x03	REAL	x	RO		Highest Precision Measurement Value
	0x04	REAL	x	RO		Lowest Precision Measurement Value

Subindex 0x01

Accumulated Zero Offset: An amount added prior to Gain to derive Value. Result of Zero Adjust Command (accumulated value).

Subindex 0x02

Highest Informational Measurement Value: Highest value that the gauge can measure without a specified accuracy.

Subindex 0x03

Highest Precision Measurement Value: Highest valid value at which the gauge is specified with an accuracy value. Above that value, the parameter Reading Valid is set to invalid.

Subindex 0x04

Lowest Precision Measurement Value: Lowest valid value at which the gauge is specified with an accuracy value. Below that value, the parameter Reading Valid is set to invalid.

5.8.8 Load Parameters Command

Execution of this command will load all parameters from non-volatile memory.

Index	SI	Data Type	NV	Access	PM	Name
FBF4	0x01	V_STRING(4)		RW		Command
	0x02	BYTE		RO		Status
	0x03	V_STRING(2)		RO		Response

Subindex 0x01

A device reset is initiated when the following byte sequence is sent.

Read:

Command: Read	
Byte 0	0x01 = slave loads the non-volatile parameters when writing 0xFB4:01 with 0x64616F6C
Byte 1	not used = 0x00
Byte 2	not used = 0x00
Byte 3	not used = 0x00

Write:

Command: Write	
Byte 0	0x6C
Byte 1	0x6F
Byte 2	0x61
Byte 3	0x64

Subindex 0x02

Status (supported values)	
0	Last command completed, no error, no response
1	Reserved
2	Last command completed, error, no response
3	Reserved
255	Command is executing

Subindex 0x03

Response	
Byte 0	See Subindex 0x02
Byte 1	not used = 0x00
